

"WTP — Technical Handover"

Everything you need to continue working on this project: where things are, how they're connected, how to make changes.

Quick start

```
..  
  
cd WTP2  
npm install  
npm run dev # dev server on localhost:5176  
npm run build # production build → dist/  
npm run deploy # push to GitHub Pages
```

Environment: requires `.env.local` with `VITE_BITRIX_WEBHOOK` for CRM form submissions.

Project structure

```
` WTP2/ ├── public/ | ├── logo-black.svg # Logo for light backgrounds | ├── logo-white.svg # Logo for dark backgrounds |

```

How things work

Translations (i18n)

All text goes through `t('key')` from `LanguageContext.tsx`. Language stored in `localStorage` (`wtp-lang`), toggle in `Navbar`.

To add a translation:

1. Open `src/lib/LanguageContext.tsx`
2. Add the key to both `en:` and `ru:` dictionaries
3. Use `t('your.key')` in any component

~200 keys currently. If the project grows to 500+, consider migrating to `react-i18next` with separate JSON files.

Product pages

`ProductPage.tsx` contains all product data inline, keyed by language then slug: ``productData[lang][slug] → { title, subtitle, intro, services[], redFlags[], result }``

Route: `/products/:slug`. Slugs: `banking`, `premium-banking`, `business-setup`, `residency`, `tax-residency`, `accounting`, `real-estate`, `wealth`.

To add a product:

1. Add data in `productData` for both `en` and `ru`
2. Add i18n keys in `LanguageContext.tsx` (`pill`, `title`, `desc`, `cta`)
3. Add a card in `LandingPage.tsx` collection grid
4. Pick accent: `--accent-magma`, `--accent-gold`, `--accent-teal`, or `--accent-nebula`

Forms → CRM

`react-hook-form` + `zod` validation. On submit → `submitToBitrix()` from `bitrix.ts` → Bitrix24 `crm.lead.add` REST API.

Webhook URL in `.env.local`:

```
VITE_BITRIX_WEBHOOK=https://irest.bitrix24.ru/rest/6729/xxxxx/
```

Styles

Single file: `src/index.css`. No CSS modules, no Tailwind.

- CSS variables in `:root` (colors, fonts, spacing, gradients)
- Component classes: `.btn`, `.card`, `.nav`, `.collection-card`, etc.
- 3 breakpoints: `desktop`, `900px`, `480px`
- 4 accent gradients: `magma` (red-orange), `gold` (dark gold), `teal` (dark blue), `nebula` (purple)

Logo

SVG wordmark, two files: logo-black.svg , logo-white.svg . Component Logo.tsx with variant and height props. Navbar: 48px, Footer: 40px.

Scripts

COMMAND	WHAT IT DOES
<code>node scripts/generate-docs-pdf.mjs</code>	Generates PDFs from all docs/*.md → public/docs/
<code>node scripts/upload-to-notion.mjs</code>	Batch uploads all docs to Notion (creates new hub)
<code>node scripts/upload-single-doc.mjs docs/file.md docs/ru/file.md`</code>	Uploads one doc to existing Notion hub

Key decisions

WHAT	DECISION	WHY
Styling	Custom CSS	Tailwind was tried, broke the design. Custom CSS works well.
i18n	React Context	~200 keys, 2 languages. Lightweight, no deps.
CRM	Bitrix24	Client's existing system.
Fonts	Playfair Display + Inter	Match the Didot-style logo. Cyrillic support.
PDFs	Puppeteer	Custom CSS templates, batch processing.
Design	Stitch MCP	Use for all UI/layout decisions going forward.

What was built (timeline)

Feb 13 – Form infrastructure: form components, validation, Submit Case + Contact pages **Feb 14** – Bitrix24 CRM integration, SEO meta-tags **Feb 16** – Major sprint:

- Logo integration (SVG, black + white variants)
- Full i18n system (EN/RU, ~200 keys)
- Responsive design (3 breakpoints, hamburger menu)
- 18 documents created (Basics, Process, Partner, LinkedIn)
- 6-month marketing strategy
- Russian translations of all documents
- PDF generation pipeline
- Notion upload (all docs bilingual)
- Product section redesign (Stitch-inspired gallery cards)
- Expanded from 4 to 8 products with full bilingual content
- Multiple rounds of UI polish (logo size, contrast, scroll, naming)

What could come next

- Deploy to GitHub Pages
- Multi-step KYC wizard (expand Submit Case)
- Email notifications on form submit (Resend / Supabase Edge Functions)
- Analytics (GA4 / Plausible)
- Performance optimization (lazy loading, code splitting)
- A/B testing on hero and CTA
- Additional languages
